

VSCode PR Review Plugin

Value Chain & KPI Framework

A strategic narrative for every layer of the organisation

Higher Mgmt

Mid Mgmt

Developers

PR Reviewers

New Joinees

What Is the Plugin?

A VSCode extension that brings AI-assisted PR review directly into the developer's IDE — and silently generates the organisation's Copilot ROI evidence as a side effect.

Self Review

Developer reviews their active file in IDE before raising a PR. Catches own issues — no context switch.

PR Review

AI reviews the full diff between source and destination branches. Comments posted directly to Bitbucket PR.

Jira AC + PR Review

Acceptance criteria from Jira combined with PR diff — AI validates whether code satisfies the story definition of done.

7 Parameters stored in IDE

- ▶ Bitbucket DC URL
- ▶ Jira URL
- ▶ Project
- ▶ Repository
- ▶ Source branch
- ▶ Dest branch
- ▶ Basic auth (user/pwd)

Output → Review comments posted to Bitbucket PR

The Strategic Insight

This plugin doesn't have **one** value story.

It has **five** — one for each layer of the organisation.

And every layer's value **feeds the layer above it.**

*The data is generated silently — as a side effect of developers doing their normal work.
No extra process. No overhead. No surveys. Just evidence.*

*"6 months ago, leadership asked teams to pilot Copilot.
This plugin is the only thing in the org that can tell you whether that pilot worked."*

Five Value Chains — One Connected System

Each layer gets a different value. Each layer's actions create evidence for the layer above.

All five chains converge → MTIM ↓ | Defect rate ↓ | Copilot adoption % | Onboarding ramp ↓ | Licence ROI ✓

KPIs — Higher Management (CTO / VP Engineering)

Their question: "We paid for Copilot. Is anyone actually using it? Did it help?"

KPI 1 | Copilot Plugin Adoption Rate

 Plugin telemetry — unique active users per week ÷ total licensed seats

Target: >60% of licensed devs active within 30 days

KPI 2 | Reviews Triggered per Project / Repo

 Bitbucket REST API — count of plugin-labelled PR comments

Target: Week-on-week upward trend across all teams

KPI 3 | Review Type Distribution

 Plugin event log — self / PR / Jira+PR split per user per week

Target: Jira+PR usage grows as team maturity increases

KPI 4 | Copilot ROI Index

 Composite: adoption rate × quality delta × time-to-merge saved

Target: Positive index by month 3 — CTO-visible dashboard

KPIs — Mid Management (Delivery Leads / Engineering Managers)

Their question: "Which teams have review gaps? Where do defects repeatedly come from?"

KPI 1 | PR Checklist (TASK) Completion Rate

 Bitbucket TASK API — checked vs unchecked before merge

Target: >90% tasks completed before merge (merge gate enforces)

KPI 2 | Recurring Issue Category Rate

 BB PR comments tagged by plugin label — category mining over time

Target: Top 3 issue types per team identified by month 2

KPI 3 | MRA Resolution Rate

 BB TASK completion correlated with merge event timestamp

Target: 100% — merge gate enforces; non-negotiable

KPI 4 | Review Cycle Count per PR

 Bitbucket PR activity — comment rounds before approval

Target: Reduction of 1+ review cycle vs pre-plugin baseline

KPIs — Developers (Code Authors)

Their question: "Is the code I raise actually aligned to the Jira story? Am I saving time?"

KPI 1 | Jira AC Review Usage Before PR Raise

 Plugin event log — Jira+PR review session followed by PR created within 2 hrs

Target: >60% of PRs preceded by AC review within 8 weeks

KPI 2 | AC Mismatch Detection Rate

 Plugin comment log — AI flagged AC-code gaps before human reviewer saw them

Target: Track AC mismatches caught pre-review vs post-review

KPI 3 | PR Rework Commits

 Bitbucket — commits pushed after PR raised (rework signal)

Target: 20% reduction vs pre-plugin baseline

KPI 4 | Time PR Raise → First Approval

 Bitbucket created_at vs approved_at across plugin-touched PRs

Target: 15–25% faster time-to-approval

KPIs — PR Reviewers (Senior Developers)

Their question: "Has the code already been validated against AC before it reached me?"

KPI 1 | AC Compliance Pre-Validation Rate

 Plugin log — % of PRs where Jira AC review ran before human review started

Target: >80% of PRs arrive pre-validated against AC

KPI 2 | Human Reviewer Comment Volume per PR

 Bitbucket — human vs AI plugin-label comment split per PR

Target: Human comment count falls as AI pre-screens AC gaps

KPI 3 | Time Reviewer Spends per PR

 Bitbucket activity — first view timestamp to approval timestamp

Target: 20% reduction in reviewer time-to-approve

KPI 4 | Checklist Task Dispute Rate

 Bitbucket task reopen events — reviewer unchecks a completed task

Target: <5% dispute rate — confirms checklist is well-calibrated

KPIs — New Joinees (Onboarding Developers)

Their question: "Am I raising better PRs as I go? Am I learning without blocking senior devs?"

KPI 1 | Self-Review Session Frequency

 Plugin event log — self-review sessions per new joinee per week

Target: >3 self-review sessions per week in first 30 days — builds self-checking habit

KPI 2 | PR Quality Improvement Rate

 Bitbucket — human reviewer comment count on new joinee PRs week-over-week

Target: Human reviewer comments reduce 30% from week 2 to week 6

KPI 3 | First PR Approval Time

 Bitbucket — new joinee first PR created_at vs approved_at vs pre-plugin cohort

Target: Measurably faster approval than pre-plugin new joinee cohort benchmark

KPI 4 | Senior Dev Time on New Joinee PRs

 Bitbucket reviewer activity — senior dev comment count on NJ PRs by week

Target: Senior comment count drops from week 4 as plugin takes over early coaching

Business-Level KPIs — What All Chains Roll Up To

Provable with Bitbucket API data + plugin event log alone. No new tooling needed.

Mean Time to Merge (MTTM)

 BB: created_at → merged_at across all plugin-touched PRs

✓ 20–30% reduction in 90 days

Defect Escape Rate

 BB issues raised post-merge vs pre-plugin baseline

✓ Measurable reduction by quarter 2

Copilot Active Usage Rate

 Plugin telemetry: unique users / week ÷ total licensed seats

✓ >70% of licensed seats active monthly

Cost per Review Cycle Saved

 (Avg senior dev hourly cost) × (review cycles reduced per sprint)

✓ Plugin pays for itself in <6 months

Onboarding Ramp Time

 BB: new joiner first PR approval delta vs pre-plugin cohort

✓ Quantified reduction — HR-reportable metric

Where Does the Data Come From?

Every KPI across all five value chains is derivable from two sources already available in the organisation.

Bitbucket REST API

- ▶ PR created_at, approved_at, merged_at timestamps
- ▶ PR comment count (human vs plugin label split)
- ▶ TASK API — checklist completion before merge
- ▶ Commit count after PR raise (rework signal)
- ▶ Reviewer activity — first view to approval
- ▶ PR labels — identify plugin-touched reviews
- ▶ Postman-provable: full review chain per PR ID

Plugin Telemetry Event Log

- ▶ User ID + session timestamp per review
- ▶ Review type used (self / PR / Jira+PR)
- ▶ Project + repo per session
- ▶ Self-review → PR raise correlation (≤ 2 hrs)
- ▶ New joinee vs veteran dev segmentation
- ▶ AC mismatch flags before human review
- ▶ Adoption rate: active users $\div$ licensed seats

Zero additional tooling or process required — data generated silently as developers work normally

The Bottom Line

01

Five value chains — one per org layer, each with its own KPIs and data source.

02

Jira AC + PR Review targets Developers and PR Reviewers — the power users who can act on AC context.

03

New joinees get a dedicated learning loop — self-review coaching, not AC validation.

04

Labels + TASK checklist = hard evidence. Merge gate enforces review quality. Postman proves it.

05

Plugin is the org's Copilot ROI engine. Zero overhead. Data generated silently as people work.
